a **Decision-generated credibility links successive decisions**

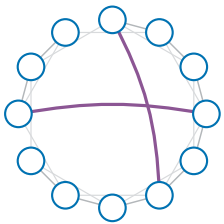

b **Two communities: the exact block matrix**

$$B_\Gamma = \begin{pmatrix} 1 - \Gamma & \Gamma \\ \Gamma & 1 - \Gamma \end{pmatrix}$$

Within a source community d, each agent has weight B_{cd}/n_d.
Receiving rows sum to one before focal self-exclusion.

c **A small world of communities**

Node:
a community

Purple edge:
rewired edge

$$B = (1 - \gamma)I + \gamma D^{-1} A$$

$$C_\theta = (1 - \theta)B + \theta \mathbf{1}\omega^\top$$

θ = 1: common broadcast; $\omega_c = n_c/N$.
