The community model is reliable away from regime boundaries
(a) Agent simulations define the benchmark
(b) The quotient differs in 25 of 121 cells
different regime
permeability Γ
social influence λ
(c) Agreement rises from 71% to 100% inside regimes
boundary or adjacent
interior
deep interior
N = 85 cells
N = 11 cells
N = 25 cells
71%
100%
100%
same predicted regime (%)
(d) Endpoint errors peak along the transition region
endpoint error (percentage points)
efficient
wrong
polarised
unresolved
