
(a) evidence accumulation
upper bound $+a$ (choose $A=1$)
lower bound $-a$
strong evidence
weak evidence
accumulated evidence
decision time
(b) confidence readout C
model ridge $E[\tau\,|\,v]$
decision time τ
evidence strength $|v|=\beta|\Delta|$
$C=\sigma(\kappa_1|v|/a-\kappa_2\log(1+\tau/\tau_0))$
(c) accuracy vs confidence
choice prob. $P(+a)$
confidence $C(v,E[\tau])$
probability
value contrast $\Delta=Q(1)-Q(0)$
